

A Systematic Approach to Develop Risk Registry Frameworks for Complex Projects.

Rana Khallaf, Nader Naderpajouh, Makarand Hastak

Abstract

The purpose of this paper is to build upon the extensive application of risk registries in the construction literature and establish a systematic methodology to develop risk registries. Risk registries channel judgment of experts as a basis for risk analysis and should be tailored for each project to be more effective. Given their prevalence, there is a need for systematic integration of tacit and explicit knowledge to develop practical risk registries.
