

# An approach for requirements based software product line testing

*Ramadan Moawad ,M. Ali Mohamed*

## Abstract

Abstract Testing in software product lines plays an important role to insuring quality not only for software products put also for the product line itself. In this paper we investigated different approaches that start the testing process from requirements in the context of software product line. Two approaches have been selected, analyzed and evaluated. Then we improved one of the analyzed approaches to solve the problems facing software product line testing.
